5 Conclusion

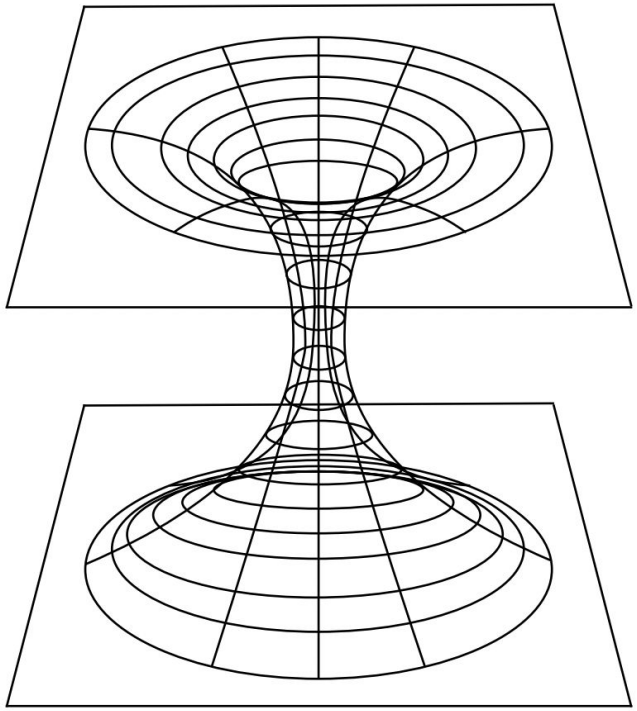
Introduction to Wormholes

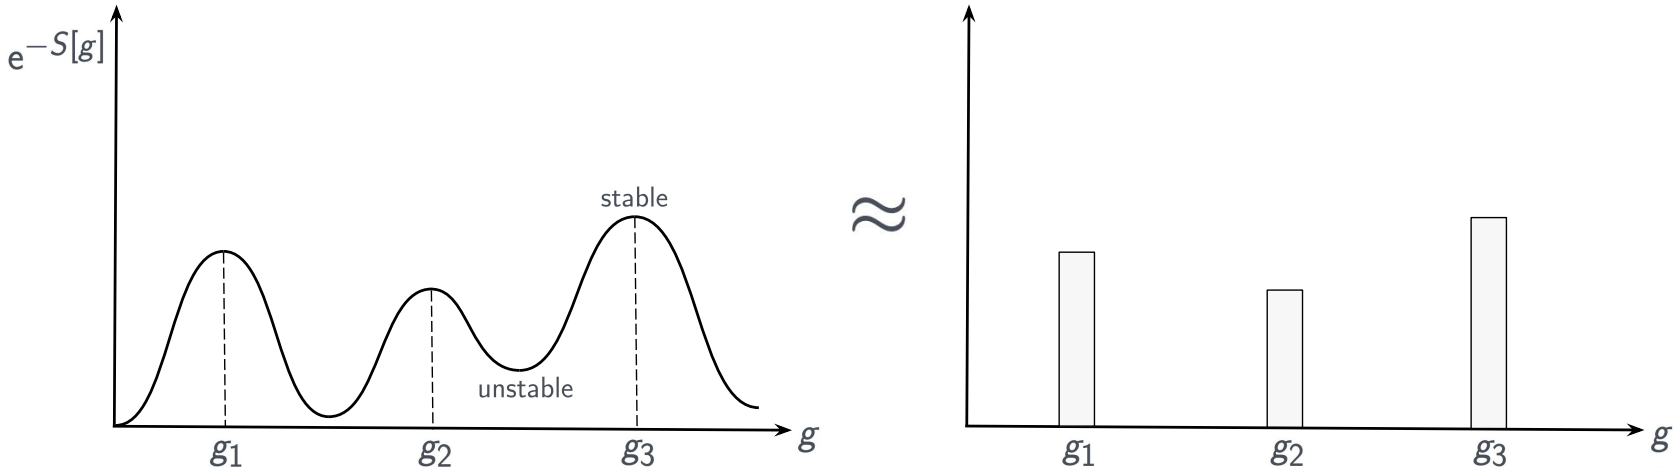
Wormholes are solutions to general relativity connecting distant asymptotic regions of spacetime



Euclidean Wormholes

Euclidean wormholes emerge as saddles of gravitational path integral, and can be used to approximate it

$$Z = \int \mathcal{D}g\, e^{-S[g]}$$



Outline

1 Introduction to Wormholes

2 The AdS/CFT Correspondence and the Factorization Problem

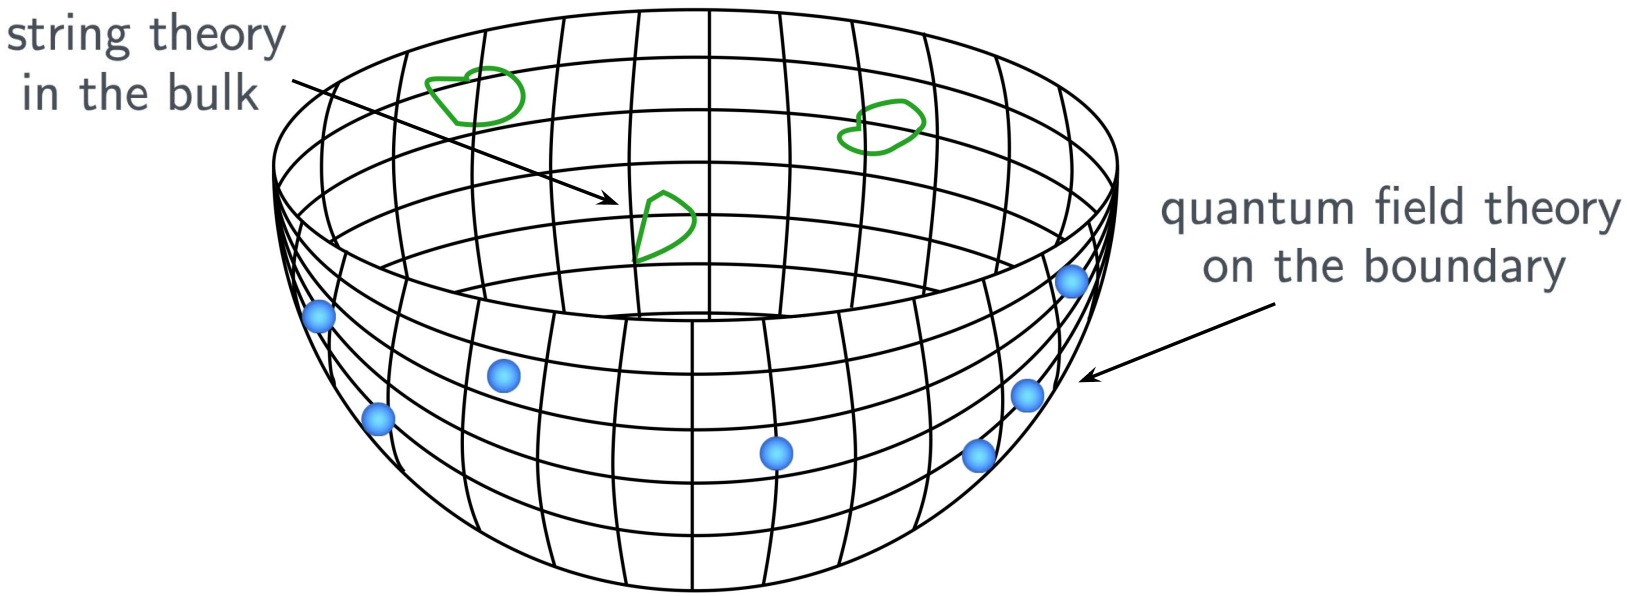
3 Wormholes and the Black Hole Information Paradox

4 Einstein-Maxwell Theory in 4D AdS

5 Conclusion

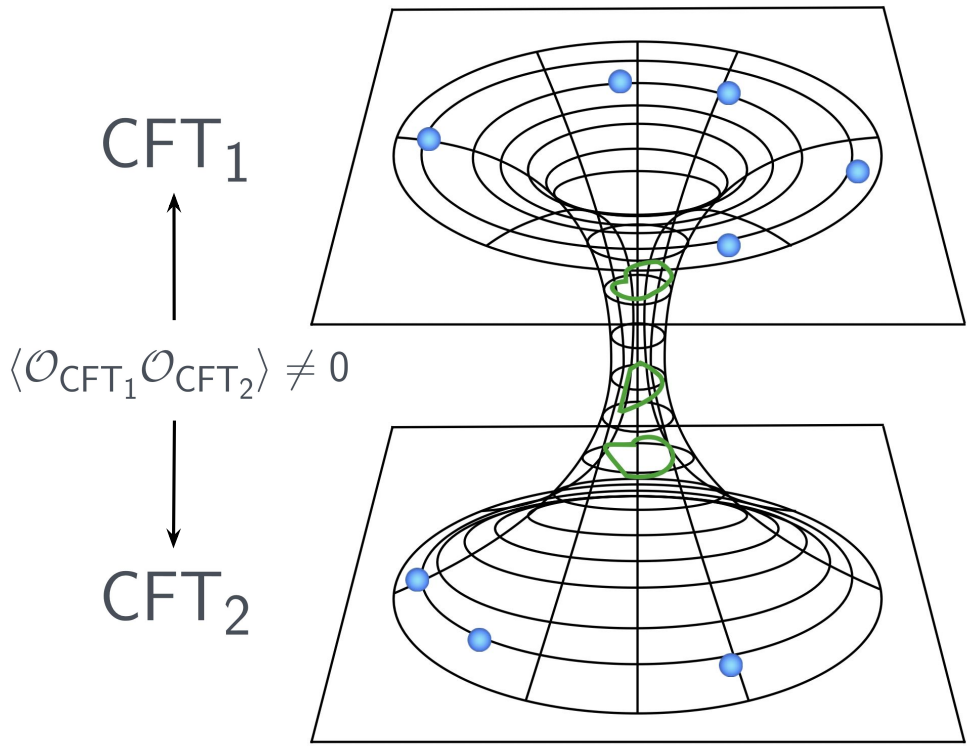
Concrete example of holography relating partition functions of different theories

$$Z_{\text{CFT}} = Z_{\text{string}}$$



AdS/CFT + Wormhole

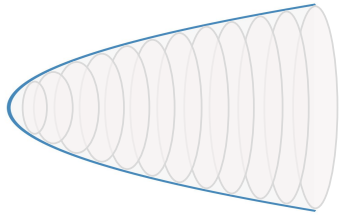
Gravity is dual to two CFTs over different boundaries, but if Z_{string} has extra wormhole contribution, CFTs must be correlated



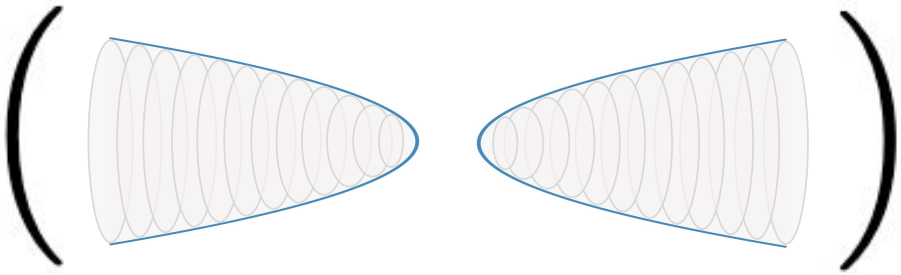
Factorization Problem

On gravity side, this means path integral fails to factorize

$$\langle Z \rangle =$$



$$\langle Z^2 \rangle =$$



$$+$$

$$\neq \langle Z \rangle^2$$

Outline

1 Introduction to Wormholes

2 The AdS/CFT Correspondence and the Factorization Problem

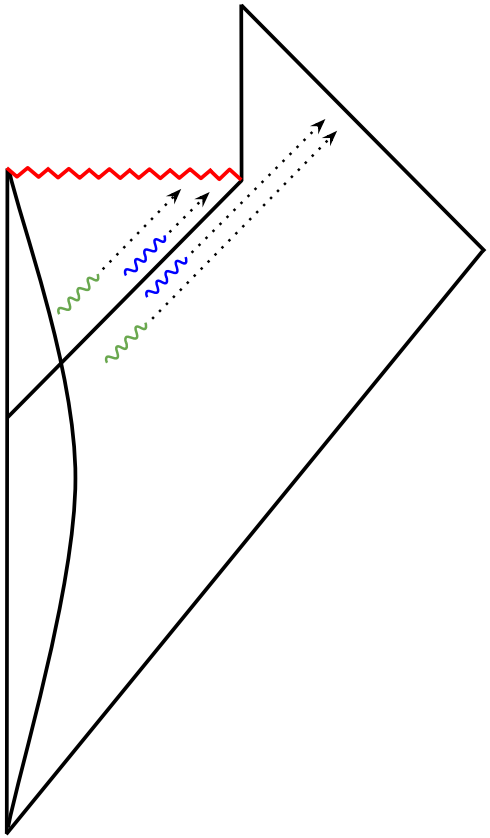
3 Wormholes and the Black Hole Information Paradox

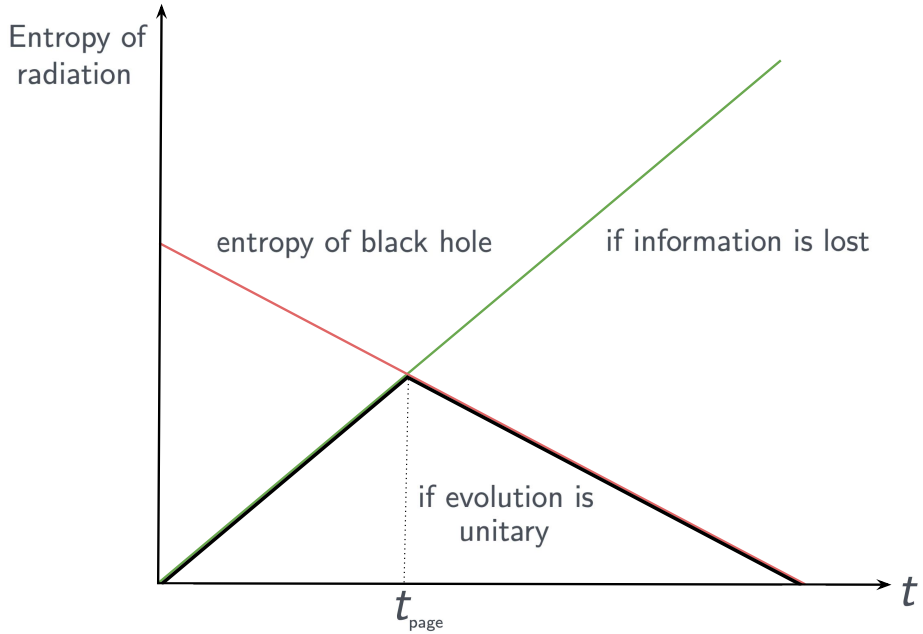
4 Einstein-Maxwell Theory in 4D AdS

5 Conclusion

Entropy of Hawking Radiation

Wormholes can help explain how information can be recovered from black hole



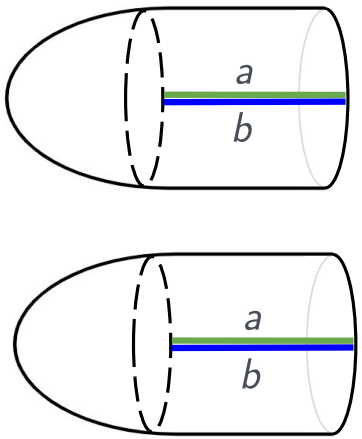


The Replica Trick

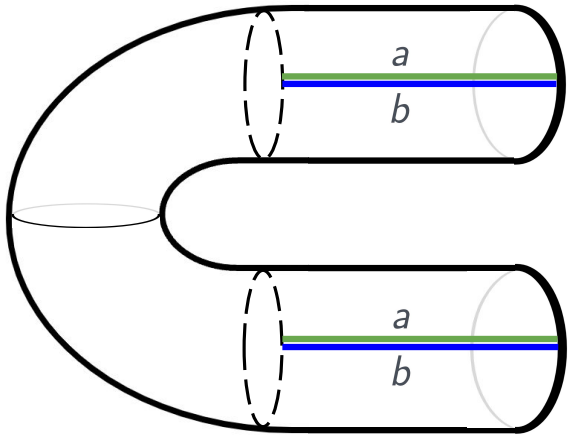
The entropy can be computed using

$$S = (1 - n\partial_n) \log \mathrm{Tr}(\rho^n)\Big|_{n=1} \quad \text{with } \rho_{ab} = \langle \Psi_a | \Psi_i \rangle \langle \Psi_i | \Psi_b \rangle$$

$$\mathrm{Tr}(\rho^2) \approx$$



$+$



$+ \cdots$

Outline

1 Introduction to Wormholes

2 The AdS/CFT Correspondence and the Factorization Problem

3 Wormholes and the Black Hole Information Paradox

4 Einstein-Maxwell Theory in 4D AdS

5 Conclusion

Einstein-Maxwell Theory in 4D AdS

Low-energy model very similar to string theory that captures important properties while remaining analytically tractable

$$S = -\int_{\mathcal{M}} d^4x\sqrt{g}\left(R + \frac{6}{L^2} - \sum_{i=1}^{3} F^i_{\mu\nu}F_i^{\mu\nu}\right) - 2\int_{\partial\mathcal{M}} d^3x\sqrt{h}K + \mathcal{S}_{\mathcal{B}}$$

with ansatzes

$$\mathrm{d}s^2 = \frac{\mathrm{d}r^2}{f(r)} + g(r)\,\mathrm{d}\Omega^2 \qquad A^i = L\frac{\sigma_i}{2}\Phi(r)$$

Code-Driven Analysis

Università degli Studi di Padova

Since calculations are elaborate, different programs were written to produce and analyze results

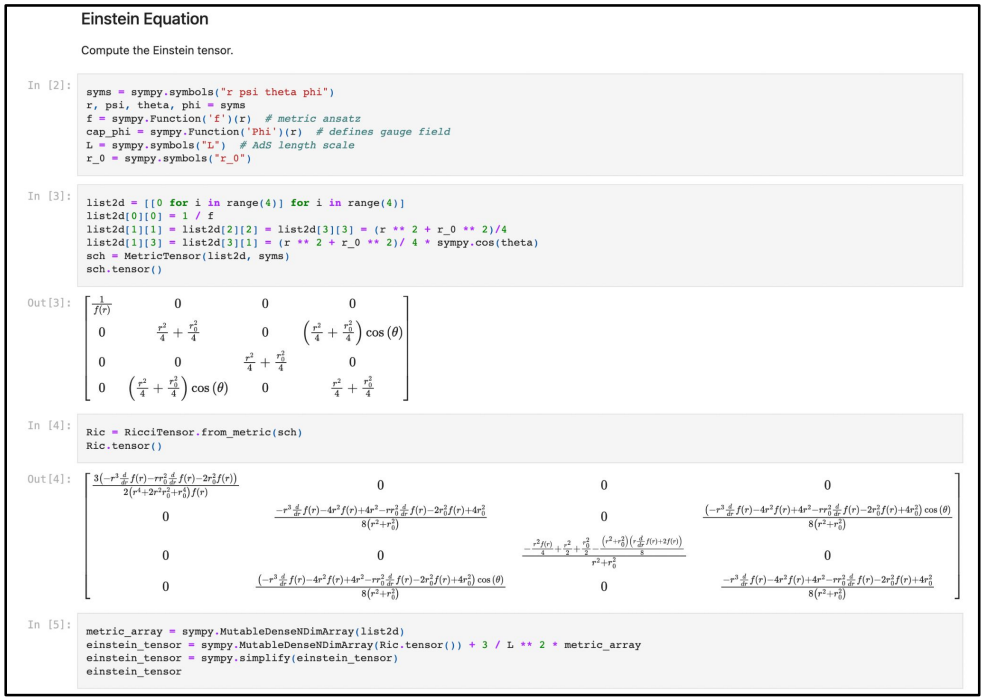
Analysis of Wormholes using Python

This repository contains code to create and evaluate wormhole solutions to general relativity using Python.

Installation

To install the requirements, create a virtual environment and run

```
pip install -r requirements
```



Einstein Equation

Compute the Einstein tensor.

In [2]:
```
syms = sympy.symbols("r psi theta phi")
r, psi, theta, phi = syms
f = sympy.Function('f')(r)  # metric ansatz
cap_phi = sympy.Function('Phi')(r)  # defines gauge field
L = sympy.symbols("L")  # AdS length scale
r_0 = sympy.symbols("r_0")
```

In [3]:
```
list2d = [[0 for i in range(4)] for i in range(4)]
list2d[0][0] = 1 / f
list2d[1][1] = list2d[2][2] = list2d[3][3] = (r ** 2 + r_0 ** 2)/4
list2d[1][3] = list2d[3][1] = (r ** 2 + r_0 ** 2)/ 4 * sympy.cos(theta)
sch = MetricTensor(list2d, syms)
sch.tensor()
```

Out[3]:

$$\begin{bmatrix} \frac{1}{f(r)} & 0 & 0 & 0 \\ 0 & \frac{r^2}{4}+\frac{r_0^2}{4} & 0 & \left(\frac{r^2}{4}+\frac{r_0^2}{4}\right)\cos(\theta) \\ 0 & 0 & \frac{r^2}{4}+\frac{r_0^2}{4} & 0 \\ 0 & \left(\frac{r^2}{4}+\frac{r_0^2}{4}\right)\cos(\theta) & 0 & \frac{r^2}{4}+\frac{r_0^2}{4} \end{bmatrix}$$

In [4]:
```
Ric = RicciTensor.from_metric(sch)
Ric.tensor()
```

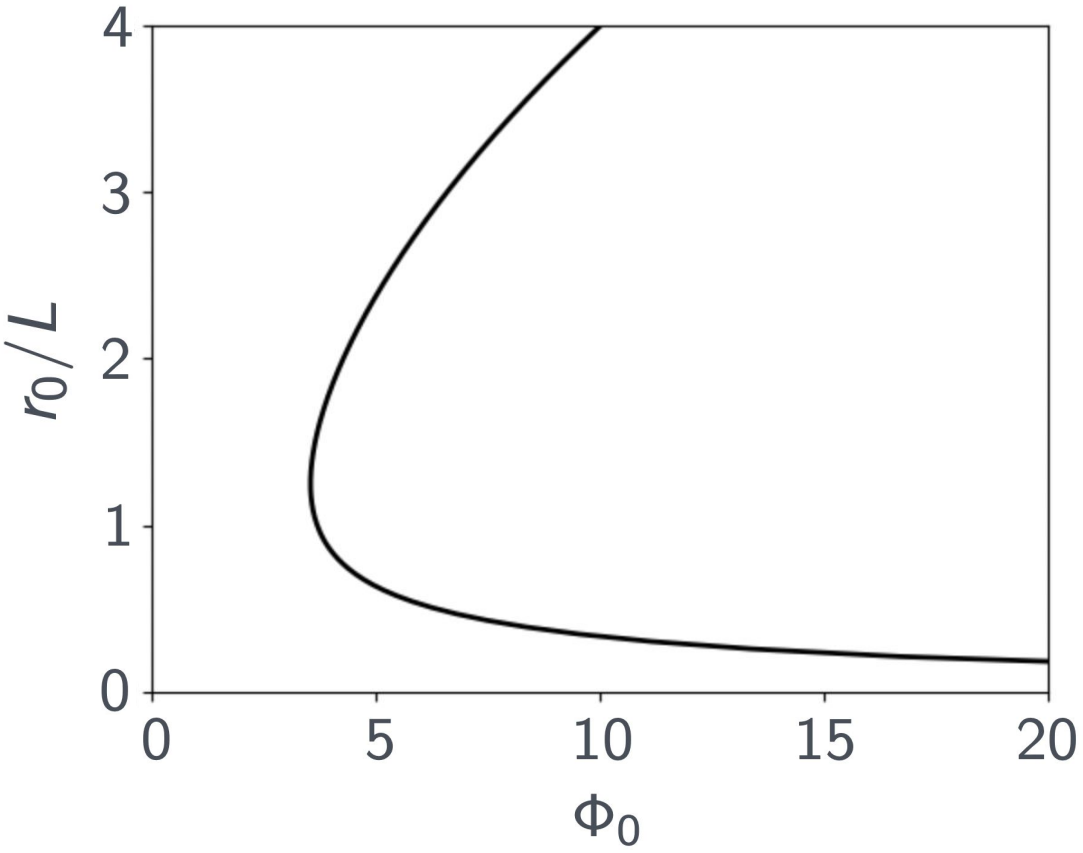
Out[4]:

$$\begin{bmatrix} \frac{3\left(-r^3\frac{d}{dr}f(r)-rr_0^2\frac{d}{dr}f(r)-2r_0^2f(r)\right)}{2\left(r^4+2r^2r_0^2+r_0^4\right)f(r)} & 0 & 0 & 0 \\ 0 & \frac{-r^3\frac{d}{dr}f(r)-4r^2f(r)+4r^2-rr_0^2\frac{d}{dr}f(r)-2r_0^2f(r)+4r_0^2}{8\left(r^2+r_0^2\right)} & 0 & \frac{\left(-r^3\frac{d}{dr}f(r)-4r^2f(r)+4r^2-rr_0^2\frac{d}{dr}f(r)-2r_0^2f(r)+4r_0^2\right)\cos(\theta)}{8\left(r^2+r_0^2\right)} \\ 0 & 0 & -\frac{r^2f(r)}{4}+\frac{r^2}{2}+\frac{r_0^2}{2}-\frac{\left(r^2+r_0^2\right)\left(r\frac{d}{dr}f(r)+2f(r)\right)}{8}}{r^2+r_0^2} & 0 \\ 0 & \frac{\left(-r^3\frac{d}{dr}f(r)-4r^2f(r)+4r^2-rr_0^2\frac{d}{dr}f(r)-2r_0^2f(r)+4r_0^2\right)\cos(\theta)}{8\left(r^2+r_0^2\right)} & 0 & \frac{-r^3\frac{d}{dr}f(r)-4r^2f(r)+4r^2-rr_0^2\frac{d}{dr}f(r)-2r_0^2f(r)+4r_0^2}{8\left(r^2+r_0^2\right)} \end{bmatrix}$$

In [5]:
```
metric_array = sympy.MutableDenseNDimArray(list2d)
einstein_tensor = sympy.MutableDenseNDimArray(Ric.tensor()) + 3 / L ** 2 * metric_array
einstein_tensor = sympy.simplify(einstein_tensor)
einstein_tensor
```

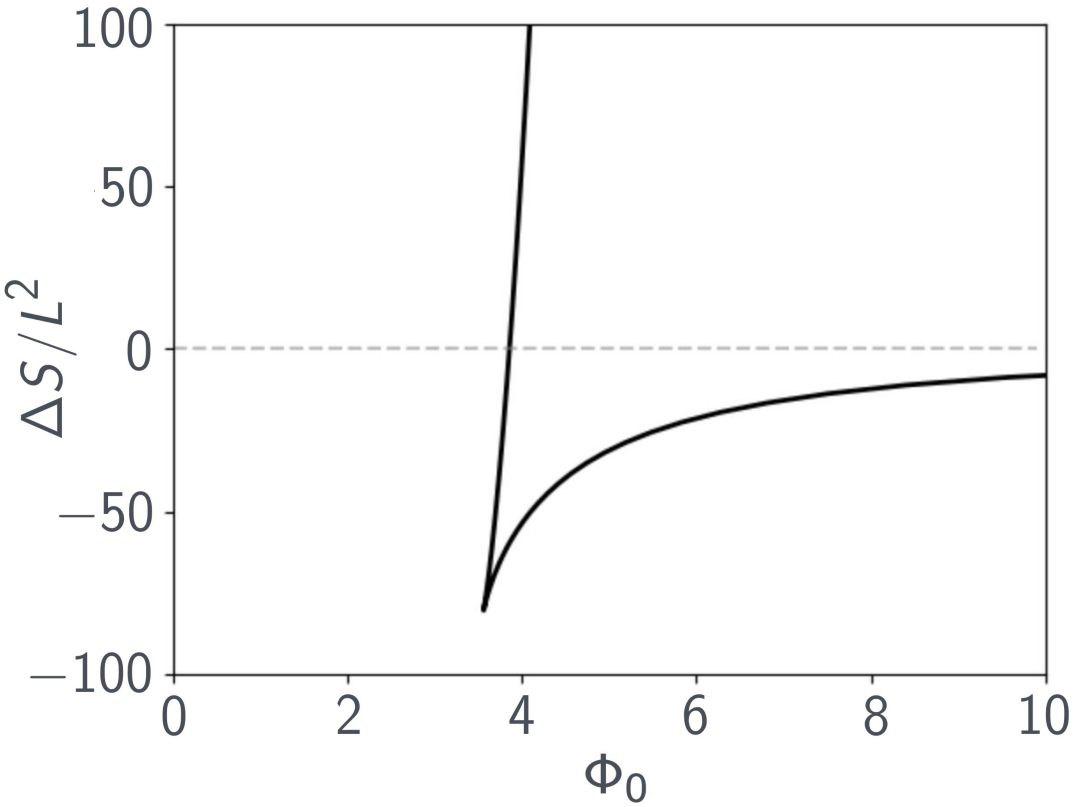
Small and Large Wormhole Solutions

There are two wormhole solutions with different throats r_0 if source of Maxwell fields Φ_0 is large enough



When Does Wormhole Dominate?

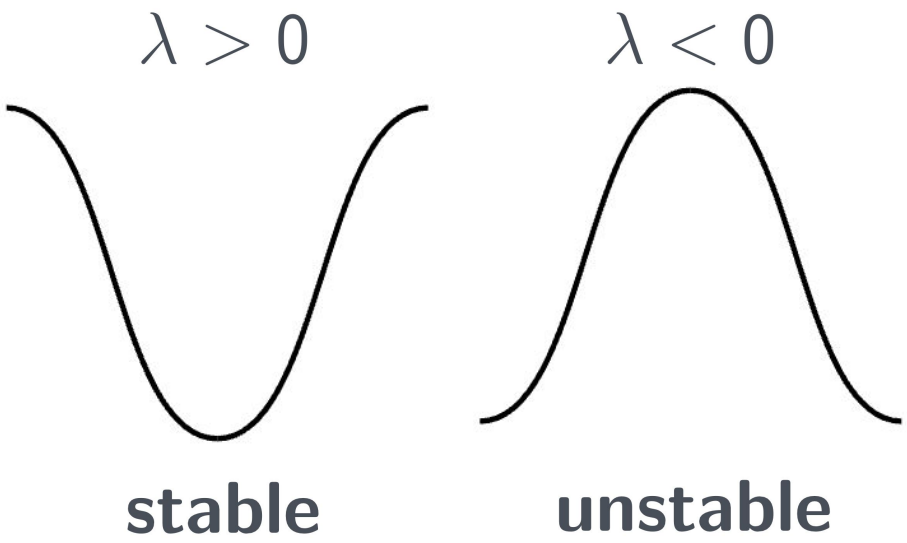
Large wormhole has lower action than disconnected solution in certain regime, suggesting it may dominate path integral



Wormhole Stability

Wormhole can dominate in path integral if it is local minimum, meaning it is perturbatively stable

$$S^{(2)} = \frac{\pi^2}{4}\int dr \sqrt{\frac{\overline{g}}{\overline{f}}} q \Big[\underbrace{-\sqrt{\frac{\overline{f}}{\overline{g}}}\left(\sqrt{\overline{f}\,\overline{g}}Kq'\right)' + Vq}_{\lambda q} \Big]$$



Negative Modes

Discretizing eigenvalue problem, negative modes can be searched for by varying r_0, demonstrating large wormhole is free of them

$r_0/r_0^{\mathbf{min}}$	**Eigenvalues**
0.8	One negative eigenvalue, $\lambda = -118$
1.0	No negative eigenvalues, $\lambda_{\text{min}} = 1.92 \times 10^{-7}$
1.1	No negative eigenvalues, $\lambda_{\text{min}} = 1.41 \times 10^{-6}$

Outline

1 Introduction to Wormholes

2 The AdS/CFT Correspondence and the Factorization Problem

3 Wormholes and the Black Hole Information Paradox

4 Einstein-Maxwell Theory in 4D AdS

5 Conclusion

Conclusion

- Wormholes introduce factorization problem, which suggests extra correlations in AdS/CFT but only serious if wormholes free of negative modes
- In low-energy model inspired by string theory, large wormhole is perturbatively stable and dominates over disconnected solution, analogous to Page transition of black hole entropy
- Other kinds of perturbations, non-perturbative channels, and string theory models need to be considered
- Factorization problem is still open and likely object of future research
